DLP® Discovery™ 4000 Starter Kit Technical Reference Manual (Product Preview)

This document describes the functionality of the Texas Instruments DLP® Discovery™ 4000 Starter Kit. The starter kit provides a reference design and development platform for the DDC4000 chipset. The DDC4000 chipset consists of a DDC4000 controller, DAD2000 power and reset drivers, and 2XLVDS DMD.

IMPORTANT NOTICE

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

In no event shall TI be liable for any special, incidental, consequential or indirect damages however caused, arising in any way from the sale or use of the TI products. Products purchased from a TI authorized distributor are subject to the distributor's terms and conditions of sale.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements. Customers are responsible for their applications using TI components unless otherwise stated, this documentation and its intellectual content is copyrighted or provided under license and may not be distributed in any form without the express written permission of Texas Instruments Incorporated.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("critical applications"). TI semiconductor products are not designed, authorized, or warranted to be suitable for use in life-support devices or systems or other critical applications. Inclusion of TI products in such applications is understood to be fully at the customer's risk.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.

Microsoft, Windows, Microsoft ActiveX, Windows XP and Windows 2000 are trademarks of Microsoft Corporation. Other trademarks are the property of their respective owners.

Notational Conventions

This document uses the following conventions.

The Discovery™ 4000 Controller Board is also referred to as Controller Board.

Program listings, program examples, and interactive displays are shown as a special typeface similar to a typewriter's. Some examples use a **bold version** of the special typeface for emphasis; interactive displays use a **bold version** of the special typeface to distinguish commands that you enter from items that the system displays (such as prompts, command output, error messages, etc.).

Here is a sample program listing:

```
0011 0005 0001 .field 1, 2  
0012 0005 0003 .field 3, 4  
0013 0005 0006 .field 6, 3  
0014 0006 .even
```

In syntax descriptions, the instruction, command, or directive is in a **bold typeface** font and parameters are in an *italic* typeface. Portions of the syntax that are **bold** should be entered as shown; portions of syntax that are in italics describe the type of information that should be entered. Syntax that is entered on a command line is centered. Syntax that is used in a text file is left justified.

Square brackets ([and]) identify an optional parameter. If you use an optional parameter, you specify the information within the brackets. Unless the square brackets are in a bold typeface, do not enter the brackets themselves.

Information about Cautions and Warnings

This book may contain cautions and warnings.

This is a description of a caution statement:

A caution statement describes a situation that could potentially damage your software or equipment.

This is a description of a warning statement:

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his/her own expense will be required to take whatever measures may be required to correct this interference.

Abbreviations and Acronyms

The following lists abbreviations and acronyms used in this manual.

APPSSFPGA	Xilinx Virtex 5 Field Programmable Gate Array for customer applications
CDS	Customer Data Sheet
DAD2000	DMD Power and Reset Driver
D4000	Discovery™ 4000
dc	Direct Current
DDR	Double Data Rate
DMD	Digital Micromirror Device
DLP	Digital Light Processing
DMA	Direct Memory Access
DRAM	Dynamic Random Access Memory
DRC	DAD Reset Controller
DVI	Digital Video Interface
EMI	Electromagnetic Interference
FCC	Federal Communications Commission
FPS	Frames per Second
FPGA	Field Programmable Gate Array
HSC	High-speed Controller
HSP	High-Speed Port
KnowledgeBase	Texas Instruments Extranet providing Discovery™ documentation, available after purchase only.
LED	Light Emitting Diode
PROM	Programmable Read Only Memory
SCP	Serial Communications Port
SRAM	Static Random Access Memory
USB	Universal Serial Bus

1 Overview

The DLP® Discovery™ 4000 Starter Kit brings a new level of resolution and performance to the Texas Instruments DLP Discovery™ product group. The Discovery™ 4000 Starter Kit may be used as a development platform to support new uses of DLP™ technology.

The Discovery™ 4000 provides substantial performance improvements including increased data rate, frame rate and resolution. Fast pixel level control of the DMD is provided through the DDC4000 control bus. Both USB and EXP standard compatible I/O connectors provide a flexible platform for advanced DMD product development. The Discovery™ 4000 supports the 2XLVDS DMD devices shown in Table 1:

TYPE	DMD_TYPE	#COLS	#ROWS	Global Reset Max FPS	Phased Reset Max FPS	#CLKS/ROW	#DIN
.9 1080p Type A	000	1920	1080	17636	23148	16	64
.7 XGA Type A	001	1024	768	22614	32552	16	32
.55 XGA Type A	010	1024	768	22614	32552	16	32
.55 XGA Type X	011	1024	768	22614	32552	16	32

Table 1 Discovery™ 4000 DMD Types

The Discovery™ 4000 Starter Kit combines the high performance DLP® Discovery™ 4000 Chip Set with a user programmable Application FPGA (APPSFPGA).

The Virtex 5 Application FPGA provides a user programmable platform for developing custom applications. The Application FPGA is connected to EXP Expansion Connectors providing compatibility with Avnet EXP compatible FPGA development products and connection for custom interfaces. An onboard USB interface provides a convenient interface for rapid prototyping. Connection for DDR2 SO-DIMM memory and SPI Flash Memory to the Application FPGA is included for customer use. A Cypress 68013 USB controller is included for customer USB control applications.

This document is provided to facilitate use of the controller board and to provide a reference design for custom hardware development.

1.1 *The Discovery™ 4000 Starter Kit*

The Discovery™ 4000 (D4000) Starter Kit provides a development platform for general application of the DMD. The D4000 starter kit includes the following:

- D4000 Controller Board
- DMD board, DMD and flex cable(s)
- Documentation Access through KnowledgeBase™
- Power cable

Not included are:

- Lab power supply, 5V @ 5A
- Xilinx DLC9G programming cable

The D4000 Controller Board provides a complete interface (USB or EXP), data manipulation (via the Virtex 5, SDRAM), DMD Control (via the DDC4000, DAD2000, and DMD) solution for new applications of DLP™ Technology.

Figure 1 is a simplified block diagram of the D4000 Starter Kit.

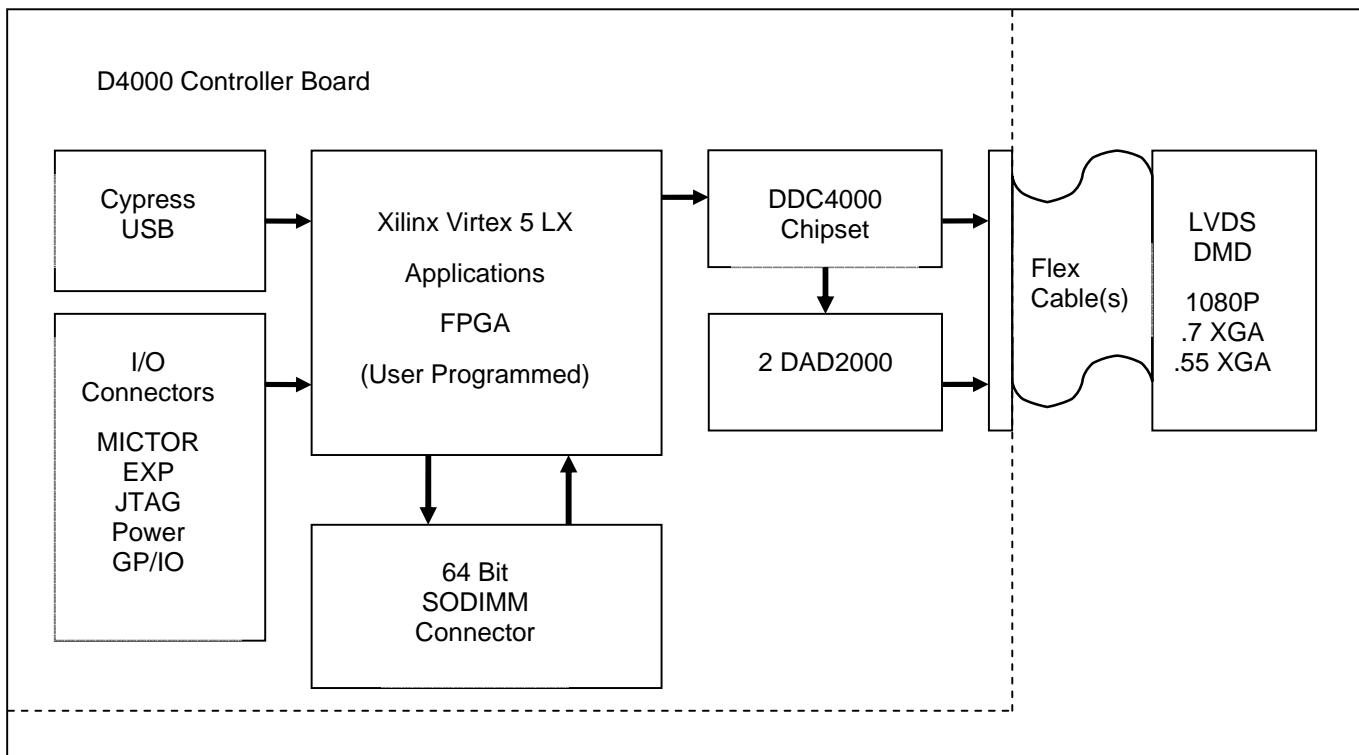

Figure 1 Discovery™ 4000 Starter Kit Block Diagram

The controller board contains:

- Two DAD2000 DMD Power and Reset Driver
 - Generates reset control of 16 banks of DMD mirrors
 - Supports higher reset frequencies

- One DAD2000 required for XGA operation, two for 1080p operation
- DDC4000 Digital Controller
 - Provides high speed 32/64 bit LVDS data and control user interface
 - Provides data and control interface to the DMD and DAD2000
- 32/64 bit 400 MHz DDR DDC4000 Data Interface
 - 32 bit interface for XGA operation, 64 bit interface for 1080p operation
- 5V power input connector
 - On-board regulation of other power supplies included
- A Xilinx Virtex XC5VLX50 Application FPGA (APPSFPGA)
 - For user development of interface and data manipulation functions.
- A 64 bit DDR2 SODIMM Connector
 - For end user development of image storage.
- An Onboard Cypress 68013A USB controller
 - For end user development of USB interface
- EXP Expansion Connectors
 - To connect to an Avnet EXP compatible motherboard product.
 - Board design includes additional LVDS pairs to support 64 bit LVDS connection through EXP connectors with a custom interface board.
- Flash Memory
 - For end user development of no-volatile storage.
- Various I/O connectors
 - Mictor test connectors for logic analyzer connection
 - JTAG headers for device programming
 - GPIO for general purpose digital IO
 - DSP Video In for connection to TI DSP development products.

1.2 Development Features

The Discovery™ 4000 Starter kit provides a development solution for the integration of DLP® Discovery™ 4000 technology into new applications of DLP™. Features include:

- A user programmable Xilinx Virtex 5 XC5VLX50 applications FPGA (APPSFPGA)
- Platform Flash PROM XCF16P to load the APPSFPGA
- JTAG connector for APPSFPGA programming
- Battery support for the APPSFPGA security encryption

- EXP connectors for connection to an EXP compatible board or other accessory board.
- Flash memory for developer use
- Cypress 68013A USB for developer use
- 64 Bit DDR2 SODIMM connector for developer use

1.3 Discovery™ 4000 Photo

The Discovery™ 4000 with 1080p DMD is shown below.

Figure 2 Discovery™ 4000 Photo

1.4 Key Components

Figure 3 shows the D4000 Controller Board key components covered in this section.

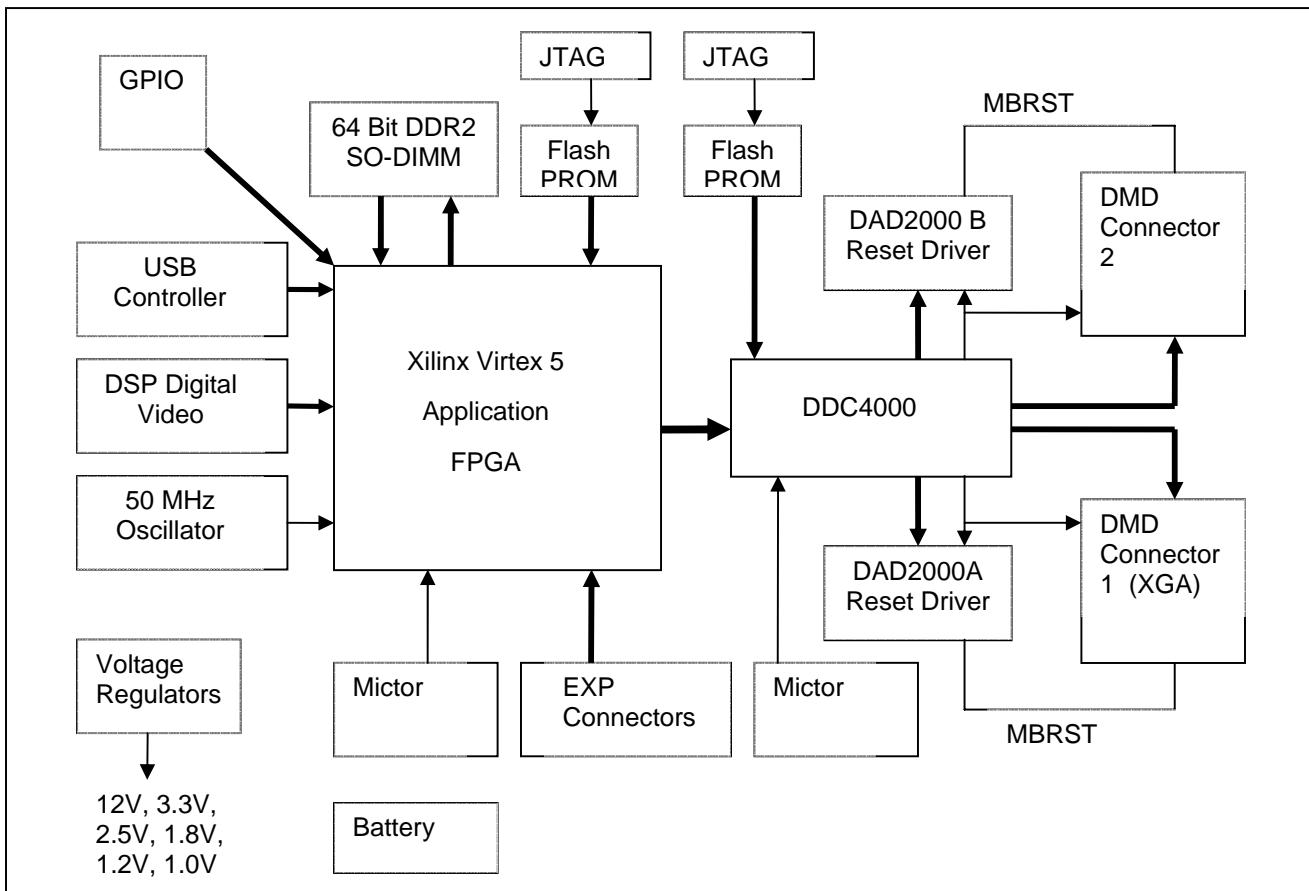

Figure 3 D4000 Controller Board Key Components

1.4.1 Xilinx Virtex 5 APPSFGPA

The Xilinx Virtex 5 LX Application FPGA (APPSFPGA) is used for development of interface and control solutions for the DMD. The APPSFPGA is connected to a number of I/O connectors, interface controllers and memory for use in prototyping a custom control solution prior to developing a custom board solution.

1.4.2 DDC4000 Controller

The DDC4000 chipset includes the DDC4000 controller which exposes a high-speed LVDS data and control interface for DMD control. This interface is connected to the APPSFPGA to support control from the APPSFPGA. The DDC4000 generates DMD and DAD2000 initialization and control signals in response to the inputs on the control interface.

For more information, refer to the DDC4000 Data Sheet TI DN 2509511.

1.4.3 DAD2000 Reset Drivers

Two DAD2000 reset drivers provide the high voltage power and reset driver functions for the DMD. One DAD2000 is required for XGA DMDs, two for 1080p DMD. J11 can be used to enable/disable the second DAD2000.

For more information on the DAD2000, refer to the DAD2000 data sheet TI DN 2506593.

1.4.4 50MHz Oscillator

The controller has a fixed 50 MHz 2.5V oscillator connected to the APPSFPGA for clock generation.

1.4.5 USB Controller

A Cypress 68013A USB controller is included for development of USB interface functions.

1.4.6 DDR2 SODIMM Connector

A 64 bit DDR2 SODIMM connector provides high speed memory connection to the APPSFPGA. Memory controller design for the APPSFPGA is not included. For a memory controller reference design visit www.xilinx.com.

1.4.7 Flash Configuration PROMs

For APPSFPGA configuration a Xilinx XCF16P Platform Flash PROM is provided. This PROM is pre-loaded with a test pattern generation program, however the customer can change the PROM programming as needed via JTAG.

The DDC4000 is configured at startup from a W25X80 serial flash PROM. The contents of this prom must not be altered.

1.4.8 Connectors

1.4.8.1 DSP Digital Video

The DSP digital video connector provides a digital video input to the APPSFPGA which is compatible with the Video Out connector of the Texas Instruments DaVinci™ DM644x EVM. No APPSFPGA or DM644x code is included for support of this connector. The connector may also be used as customer defined I/O.

1.4.8.2 JTAG Headers

The JTAG header ports provide a programming interface to the FPGAs and flash configuration PROMs. The JTAG header H1 accesses the Virtex 5 Application FPGA. The JTAG header H2 accesses the DDC4000 Lattice ECP2 and should not be used.

1.4.8.3 Mictor Connectors

The Mictor connector support connection of logic analyzer to APPSFPGA and Cypress 69013A signals for development support.

1.4.8.4 DMD Connectors

Two DMD connectors accept the DMD flex cable(s). Both cables are necessary to drive a 1080p DMD. One cable drive connected to J13 is used for XGA DMD.

1.4.8.5 GPIO Connectors

General purpose digital IO connectors.

1.4.9 Battery

A battery provides power for encryption security in Virtex 5. See Xilinx Virtex 5 data sheet for more detail.

1.4.10 Power Supplies

Onboard voltage regulation is provided for all required power supplies. This section lists controller voltage regulators and their purpose(s).

1.4.10.1 Power Connector

The D4000 controller board must be provided a 5 V 5 Amp supply.

1.4.10.2 VREG 1.0V

This delivers 3 Amps at 1.2 Volts as the Virtex 5 core supply.

1.4.10.3 VREG 1.2V

This delivers 3 Amps at 1.2 Volts as the Lattice 3 core supply.

1.4.10.4 VREG 1.8V

This delivers 3 Amps at 1.8 Volts for the DDR2 supply and FPGA I/O.

1.4.10.5 VREG 2.5V

This delivers 6 Amps at 2.5 Volts to supply the XCF16 FPGA I/O.

1.4.10.6 VREG 3.3V

This delivers 3 Amps at 3.3 Volts. Supply for DDC4000 prom and DMD.

1.4.10.7 VREG 12V

This delivers the DAD2000 12V 0.5 A supply.

2 Getting Started

The following steps should be followed in starting board operation using the default APPS FPGA code installed at the factory :

- 1.) Connect 5V, 5 A power supply to the supplied power cable. Connect the power cable to J12 with the power supply OFF.
- 2.) Confirm all SW2 switches are in the OFF position. Confirm all 5 H1 jumpers are in place. If using a 1080p DMD confirm J11 is installed.
- 3.) Connect the DMD to the board with the flex cable(s). One flex cable attached to J13 is used for XGA DMDs, two flex cables attached to J14 and J14 are used for 1080p DMD.
- 4.) Turn the power supply ON. D2 and D3 should briefly display red then green to indicate APPS FPGA and DDC4000 configuration. D8 should flash green at 1 Hz. D9 should display green. The DMD will repeatedly cycle through several test patterns.

To stop operation :

- 1.) Press SW2 to float the DMD, then turn power OFF.

3 User Connectors and I/O

This section describes the use of each D4000 Controller Board external connector and provides pin out information. Figure 4 and Figure 5 show connector locations on the D4000 controller board.

3.6 J10 USB/APPSFPGA Mictor Connector

J10 is the Mictor connector for the USB controller and APPSFPGA Application FPGA. Signals from the USB or APPSFPGA are routed to the connector as selected by jumper J6. Refer to the Discovery™ 4000 Schematic for more information. Signals can be routed to the connector by HDL code and monitored with a logic analyzer to support development.

Table 7 J10 USB/APPSFPGA Mictor Connector

3.7 J13 and J14 DMD Flex Connector

Connectors J13 and J14 provide control and data signals to the DMD flex connectors. These connectors are used for DMD connections.

3.8 J500 DDR2 SODIMM Connector

Connector J500 provides a DDR2 SODIMM memory socket. No memory module is included. Memory controller design for the APPSFPGA is not included. For a memory controller reference design visit www.xilinx.com.

Table 8 J500 DDR2 SODIMM Connector

3.9 J501, J502 EXP Connectors

J501 and J502 provide connections compatible with the Avnet EXP Bus Specification. Refer to www.em.avnet.com/exp for more information. J501 and J502 may also be used as high speed interface connectors for accessory boards. The D4000 controller board routes some of the single ended signals as differential pairs to support a full 64 bit LVDS data bus. This routing may interfere with the use of some of the EXP single ended signals as noted in the table footnote.

Table 9 J501, J502 EXP Connectors

3.10 H1 Xilinx APPSFGA JTAG header

Provides direct connection for a Xilinx JTAG programming cable. Xilinx Model DLC9G is recommended. Visit www.xilinx.com for more information.

Table 10 H1 Xilinx APPSFGA JTAG Header

Pin number	Pin name
1,3,5,7,9,11,13	GND
2	P2P5V
4	TMS
6	TCK
8	TDO
10	TDI
12,14	NC

3.11 H2 DDC4000 JTAG Header

Provides direct connection for a Lattice JTAG programming cable. This connector will not be used for normal development or operation.

Table 11 H2 DDC4000 JTAG Header

Pin number	Pin name
1,3,5,7,9,11,13	GND
2	P2P5V
4	TMS
6	TCK
8	TDO
10	TDI
12,14	NC

4 Configuration Jumpers

This section describes the D4000 Controller Board configuration jumpers. Figure 6 shows jumper locations on the D4000 controller board.

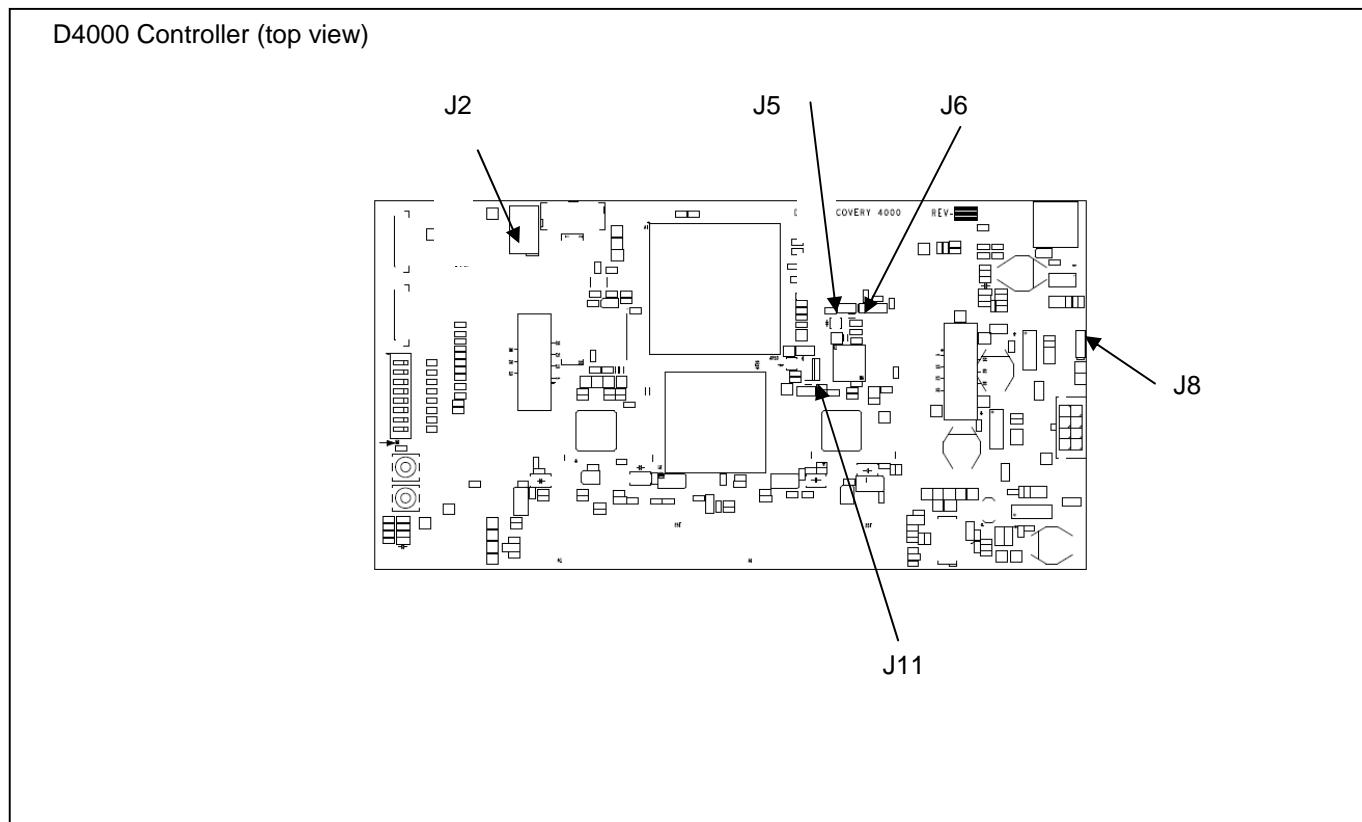

Figure 6 D4000 Controller Configuration Jumpers

4.1 J2 – EXP Voltage Select

J2 – Used to select either 2.5V or 3.3V voltage supplies for the EXP bus FPGA banks. This setting should match the I/O voltage required by any board attached to the EXP connectors.

Position	Bank Voltage
1-2	3.3V
2-3	2.5V

4.2 J5 – Application FPGA Revision Select

J5 – Used to select the revision of firmware in loaded from the PROM to the APPSFPGA.

Jumper Position	Revision Version
0-1	0
1-2	1

4.3 J11 – DAD2000 B Output Enable

J11 – Used to enable the outputs for DAD2000 B. This needs to be enabled only if using the 1080P DMD, otherwise this can be disabled.

Jumper Position	DAD2000 B Outputs
0-1	Disabled
1-2	Enabled

4.4 J6 – Shared USB signal disabled

J6 – Used to connect or disconnect the USB signals that are shared between the USB/APPSFPGA Mictor Connector J10. This could be useful to isolate test signals from the FPGA to the Mictor connector.

Jumper Position	USB Signals
0-1	Disconnected from FPGA
1-2	Connected to FPGA
2-3	Automatically connect USB signals to FPGA when USB is connected to host PC

4.5 J8 – USB EEPROM Programming Header

J8 – Used to temporally disconnect the USB EEPROM from the device so the device can load its internal boot loader rather than any code in the EEPROM. Install J8 for Cypress internal boot loader.

4.6 H1 – JTAG interface Virtex 5

H1 Provides a JTAG interface to program Virtex 5 Application FPGA and its associated PROM.

Table 12 H1 APPSFGA JTAG header

Pin number	Pin name
1,3,5,7,9,11,13	GND
2	P2P5V
4	TMS
6	TCK
8	TDO
10	TDI
12,14	NC

4.7 H2 – JTAG interface Lattice ECP-2

H2 Provides a JTAG interface to program the Lattice ECP2 FPGA and its associated PROM.

Table 13 H2 ECP2 JTAG header

Pin number	Pin name
1,3,5,7,9,11,13	GND
2	P2P5V
4	TMS
6	TCK
8	TDO
10	TDI
12,14	NC

5 Switches

This section defines the function of D4000 switches.

5.1 Dipswitches – SW1

Functionality defined by APPSFPGA programming. In default test pattern code:

Table 14 Dipswitch Assignments

Switch Number	Effect
1	ON = float – float all mirrors
2	ON = counter halt – stop counter, this will freeze the image on the DMD
3	ON = complement data – causes DDC 4000 to complement all data it receives
4	ON = north/south flip – causes the DDC 4000 to reverse order of row loading, effectively flipping the image
6 and 5	Dictates the type of reset being used (where switch 6 is the MSB and ON = 1): 00 : single block phased reset 01 : dual block phased reset 10 : global reset 11 : quad block phased reset
7	ON = Row Address Mode
8	ON = WDT Enable, disables other resets

5.2 Push Button Momentary Switch – SW2

Functionality defined by APPSFPGA. This switch is used for PWR_FLOAT in the default code.

5.3 Push Button Momentary Switch – SW3

Functionality defined by APPSFPGA. This switch is used for reset in the default code.

6 Power and Status LEDs

This chapter provides an illustration of indicators used to verify that the DDC4000 Controller Board is functioning properly. Figure 7 shows the controller board indicator locations.

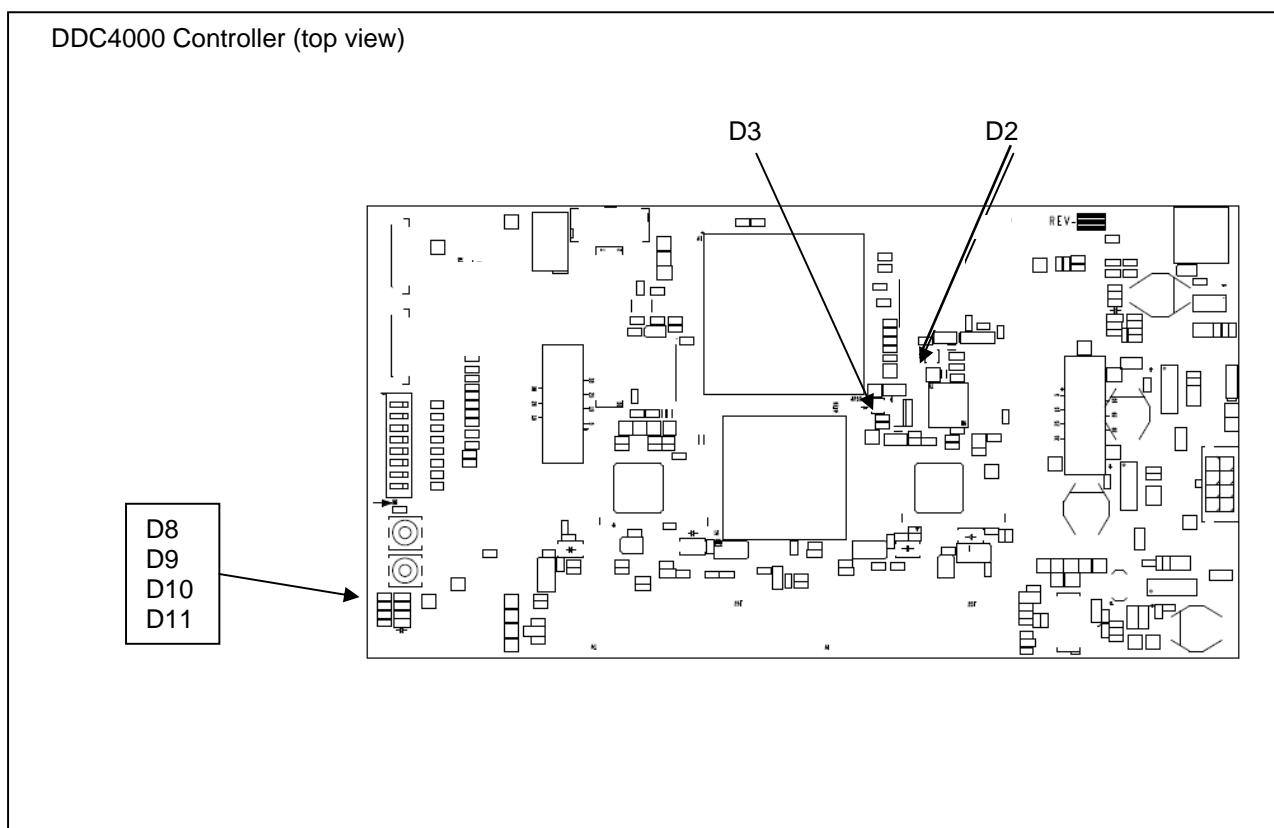

Figure 7 DDC4000 Controller Board Indicators

6.1 D2 – APPS FPGA done

D2 is a two color LED, red and green.

The red side is turned on when the APPS FPGA DONE pin is low, not DONE. Red turns off when the DONE pin goes high indicating the APPS FPGA completed programming successfully. To further assure the APPS FPGA is up and running, the green LED is turned on by internal logic once all pins are turned on. This logic is to be defined by the application, although it could be a DCM lock monitor or a ‘heart beat’ indicating clocks are operating, the default load drives this with a simple high to turn the green LED on.

6.2 D3 – DDC4000 done

D3 is a two color LED, red and green.

The red side is turned on when the DDC4000 DONE pin is low, not DONE. Red turns off when the DONE pin goes high indicating the DDC4000 completed programming successfully. Green turns on when I/O pins are enabled after programming.

6.3 D8 – DDC_LED0

D8 – DDC_LED0 – Status LED for the DDC4000. See the DDC4000 data sheet for more details.

6.4 D9 – DDC_LED1

D9 – DDC_LED1 – Status LED for the DDC4000. See the DDC4000 data sheet for more details.

6.5 D10 – VLED0

D10 – VLED0 – This logic is to be defined by the APPSFPGA application. Drive low to turn on the led. Drive high to turn off the led.

6.6 D11 – VLED1

D11 – VLED1 -This logic is to be defined by the APPSFPGA application. Drive low to turn on the led. Drive high to turn off the led.

7 Test Points

This chapter defines the location of on-board test points.

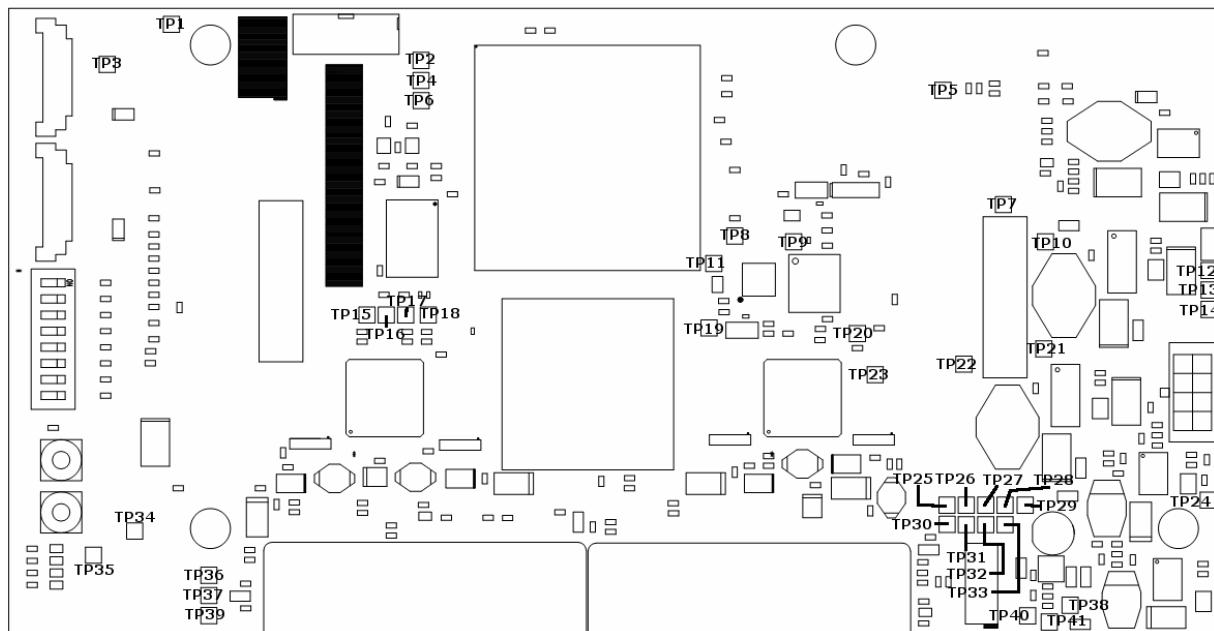

Figure 8 Test Point Locations

Table 15 Test Points

Test Pont	Net Name	Test Point	Net Name
TP1	GROUND	TP2	V5_DXP
TP3	VCC_VREF	TP4	V5_DXN
TP5	GROUND	TP6	RESET
TP7	2.5V TEST	TP8	ECP2_CCLK
TP9	SCPDO	TP10	3.3V TEST
TP11	ECP2_SISPI	TP12	USB_EA
TP13	VCC_3P3V	TP14	VCC_2P5V

TP15	MBRST1_8	TP16	DAD_A_IRQZ
TP17	ECP2_SPIDO	TP18	ECP2_CS#
TP19	SCPCLK	TP20	DAD_B_IRQZ
TP21	1.8V TEST	TP22	PWRGD
TP23	MBRST2_0	TP24	1.2V TEST
TP25	SCPDI	TP26	DMDSPARE2
TP27	MBRST2_8	TP28	VCC_12V
TP29	GROUND	TP30	VCC_1P2V
TP31	DMDSPARE3	TP32	GROUND
TP33	VCC_1P8V	TP34	VCC_1P8V
TP35	PSUHBNT_RST #	TP36	DMDSPARE0
TP37	MBRST1_0	TP38	1.0V TEST
TP39	DMDSPARE1	TP40	12V TEST
TP41	VCC_1P0V		

8 Documentation

This section lists related documents associated with the use of the DDC4000 Controller Board.
